

ACC NR: AP7003025

receiver sensitivity thus achieved was 2—3 μ v at a signal-to-noise ratio of two. The display and recording equipment was triggered by the received pulses and was protected from spurious noise by 1) utilization of the coincidence of two consecutive marker pulses for correlating purposes, 2) pre-selection by repetition frequency discrimination, and 3) spurious signal suppression using a special detuned noise receiver. The displayed frames were filmed. Each frame contained information on the distance from the point of reflection of the transmitted pulse, the meteor echo diffraction pattern, the Doppler shift pattern, the date and time, and the antenna direction.

The horizontal component of the unit velocity of meteor trail movement was obtained from direct readings of the radial trail velocity components as recorded by the Doppler shifts. The direction of meteor trail movements was determined from the Doppler shift phase difference obtained at the outputs of two phase detectors in which the reference signals were approximately in quadrature.

The drift velocity readings had considerable fluctuations and, for this reason, were averaged on an hourly basis. The averages were used to study diurnal wind pattern changes. In order to secure meaningful averages using the equipment at hand (based on at least 50 measurements/hr),
Card 2/4

ACC NR: AP7003025

measurements were made alternately, first in the NS and then in the EW directions. The results obtained at the same time of day but for different days were combined. Thus, about 7000—9000 individual readings were recorded during one 5—7 day measurement session.

On the basis of the observation results, it was established that the magnitude and direction of winds varied from day to day and from month to month. The experimental curves of wind velocities were analyzed by Fourier series, i. e., they were reduced to a constant component and three harmonics (corresponding to 24-, 12-, and 8-hour variations). The second harmonic was predominant. The velocities of the zonal wind components attained maximum values of 20—30 m/sec in April and June. These velocities were lowest during January and March (1—5 m/sec); during February and May they were 12—15 m/sec. The direction varied from easterly during February and March to westerly during the April—May period, and again to easterly in June. The meridian wind components were directed to the south during every month except March. The magnitudes of these components varied from 5 to 18 m/sec; the maximum was observed in March.

Comparison of these results with the published data from similar studies at Manchester and Khar'kov established that similarities exist in
Card 3/4

ACC NR: AP7003025

the monthly variations and that in all three cases the wind velocities decrease during spring and summer. The curves of the meridian wind components exhibit certain similarities, but the zonal component curves show closer agreement. The data are different when the relative magnitudes of the wind velocities for the three locations are considered. Both wind components at Manchester were weaker than those studied in the USSR. This is attributed to the different climatological conditions at the points of observation and to the different times of observation with respect to the 11-year solar activity cycle. AUTHOR: Lysenkó, I.P., Tsymbal, A.M. and Kul'bachnaya, M.Z.

TITLE: On the Pathogenesis of Listerellosis. Author's Summary

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959,
Nr 9, pp 127 (USSR)

ABSTRACT: The aim of the work was to study the connection between the development of experimental listerellosis in guinea pigs and the degree of disturbance of the body's barrier fixation function. It was found that, where this function was artificially disturbed, listerellosis developed in most (66.6%) of the animals. The other animals in this group were cleared of Listerella within 29 days. Where the barrier fixation function was not disturbed the infection did not, as a rule, evince or develop any clinical symptoms and the animals were free of Listerella within 29 days. If the barrier fixation function then was disturbed in this second group of animals 12 days after the start of the test, clinically pronounced listerellosis was provoked in some of the animals and in some of the others the period, during which Listerella were present in the body, was extended. The results suggest that

Card 1/2

On the Pathogenesis of Listerellosis. Author's Summary SOV/16-59-9-33/47

the decisive role in the pathogenesis of listerellosis in susceptible, but not highly-sensitive, animals is the body's general power of resistance. A weakening of the resistance, particularly by disturbance of the barrier fixation function, can lead to the development of a clinically pronounced form of listerellosis.

Kyyiv. Ukrayins'kyy naukovo-doslidnyy instytut metaliv

Vprobadzhennya novoyi tekhniki i tekhnologiyi na metalurhiynykh zavodakh Ukrayiny; zbirnyk, t. 3 (Introduction of New Techniques and Technology in Ukrainian Metallurgical Plants; Collection of Articles, Vol. 3) Kyyiv, Derzhtekhvydav URSR, 1958. 192 p. 1,000 copies printed.

Exec. Ed.: H. Afonina; Tech. Ed.: P. Patsalyuk.

PURPOSE: The book is intended for metallurgists employed in rolling and slabbing operations.

COVERAGE: This is a collection of 11 Ukrainian articles, compiled by 22 authors, some of whom are referred to as eminent specialists. The subjects dealt with in the articles are: use of limestone-fluxed slag in making pig iron, use of blast-furnace gas under increased pressure, use of oxygen in making steel in open-hearth and Bessemer furnaces, description of a new method of "intensified" squeezing of slabs in blooming mills. Some design details, with direct references to actual plants and certain operational

Card 1/4

Introduction of New Techniques (Cont.)

SOV/1574

practices are also featured. Introduction of full mechanization of rolling processes at steel-works is taking place. Numerous diagrams accompany the text. Some articles have bibliographic entries, mainly Soviet.

TITLE: On the Problem of Replacing Coke Breeze Employed During Sintering
of Iron Ores by Anthracite Culm (K voprosu o zamene koksika pri
aglomeratsii zheleznykh rud antratsitovym shtybom)

PERIODICAL: Byul. nauchno-tekhn. inform. Ukr. n.-i. in-t metallov, 1958, Nr
5, pp 8-15

ABSTRACT: A description of the results of experiments dealing with the replacement of coke breeze employed in the sinter charge during sintering of concentrates of Kerch' ores by anthracite culm (AC). The initial sintering was conducted in a circular vat 400 mm high and 500 mm in diameter, which yielded up to 55 kg of sinter (S) in one batch, and was then continued directly in the continuous sintering machines of the Kamysh-Burunskaya sintering plant. The AC contained 16.1% cinder. Experiments demonstrated that the substitution of the AC does not impair the quality of the S obtained and is not responsible for the increased fuel consumption during the process. The productivity of sintering machines producing unfluxed S decreased by 4-5% when AC

Card 1/2

On the Problem of Replacing Coke Breeze Employed During Sintering (cont.) SOV/137-59-1-272

was employed. Compared with the standard technology of the production of fluxed S, the employment of the AC makes it possible to increase the productivity of the continuous sintering machines by 4-7% (according to laboratory data).

AUTHORS: Sidorov, N. Ye., Lysenko, I. S., Antonov, V. K., Zaporozhets, N. P.

TITLE: On the use of heated and oxygen-enriched air during the sintering of iron ores

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 10, 1961, 12, abstract 10V85.
("Sb. tr. Ukr. n.-i. in-t metallov", 1960, no. 6, 34 - 44)

TEXT: Laboratory sintering was performed with a 225 mm high charge layer, 2.5 - 4.5% C and 1.0 basicity. When sintering Krivoy Rog ores, an increase of the air temperature up to 100 and 300°C, entailed a reduction of specific fuel consumption by 12.5 and 25.0% and raised the output from 73.4 to 85.5% (+ 10 mm fraction). When sintering Kerch ores air heating up to 200 - 250°C raised the degree of As volatility from 20 and 13% to 30.7 and 26.9%. The use of air, heated to 160 - 175°C by gas combustion over a charge layer during 25% of the whole sintering time, raised the efficiency by 3.5%, the output from 76.3 to 80.4%, although O_2 was reduced from 20 to 18.3% in the infiltrated air. Air heating over vacuum-chambers 3 - 8 should proceed as follows: a) by gas combustion (Q 1,400 kcal/m³) at its consumption of 13 m³/t of sinter and about 200°C air temperature, making it ✓

Card 1/2

possible to save up to 20% fuel or b) by the mounting of an additional ventilator and cooling of the sinter over vacuum chambers 12 - 13, thus facilitating the exhauster operation. Enrichment of the air with O₂ from 20.0 to 22.9% increased the sintering speed from 35.3 to 29.2 mm/min at an unchanged strength of the sinter. Simultaneous air heating to 150 - 200°C and increasing of O₂ to 22.9% raised the sintering speed to 40.9 mm/min at a reduction of the fuel consumption from 4.0 to 3.0%. Enrichment of the air with O₂ at the moment of ignition of the charge, from 20.0 to 30.7%, increased the output of the sinter from 78.8 to 85.2%.

TITLE: Methods of Investigation of Gates in Hydroelectric Stations

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Energetika, 1958, Nr 1, pp 117-124

ABSTRACT: Methods of laboratory investigation of turbine gates of a hydroelectric station are discussed; the methods were developed during an investigation on models of an emergency-and-repair cylinder gate of the Kama-River station. The following points were investigated: finding the simulation limits, allowance for turbine operating conditions, allowance for cavitation, etc. The following conclusions are drawn: (1) simulation and Euler's transfer of model investigation results to the prototype are permissible even in the case when simulating conditions do not hold true for the entire hydrostation; (2) representing the turbine as a hydraulic resistance permits solving the problem of discharge through the station during the gate closing with the turbine

Card 1/2

SOV/112-59-1-438

Methods of Investigation of Gates in Hydroelectric Stations

in operation; (3) if the gate is investigated in a station that is lacking the turbine model, the simulation of the wicket-gate mechanism, piers, and other entrance components is necessary; (4) if the gate cavitation is not simulated in the experiments, the two extreme cavitation cases permit evaluating the range of the gate loads, averaged in time and area, under cavitation conditions. A simple Euler's transfer of model-test results to prototype conditions with a cavitation-type flow in the gate is inadmissible in principle and may lead to rough errors. Five illustrations. Bibliography: 2 items.

ABSTRACT:

Rotating valves for water pressure conduits of hydraulic installations, in use abroad since 1908, are being introduced into Soviet hydraulic construction due to the suggestion of the Member-correspondent of the AS USSR, B.K. Aleksandrov and Engineer N.A. Yegorov, and will be used for the horizontal aggregate of the Kama Hydroelectric Plant. Research on these valves was conducted by the Chair of Hydraulic Installations of The Moscow Power Institute together with workers of the Moskovskaya proyektchnaya kontora "Gidrostal' proyekt" (The Moscow Designing Office of the "Gidrostal'-proyekt"), under the general direction of Professor V.G. Ayvaz'yan. The following conclusions were reached: 1) these valves have superior hydraulic properties in comparison with other types now in use in the USSR; 2) construction features are satisfactory and are superior to the greatest part of presently used locks; 3) the method of computation

Card 1/2

98-58-7-8/21

Rotating Valves for Water Pressure Conduits of Hydraulic Installations.

of the lock (proposed in this article) does not need any laboratory tests; 4) rotating valves are highly recommended for Soviet hydraulic constructions. There are 4 graphs, 1 diagram, and 7 references, 4 of which are Soviet, 2 German and 1 American.

TITLE: Determination of niobium in steels containing tungsten

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1961, 115, abstract
19D62 (Sb. tr. Tsentr. n.-i. in-t chernoy metallurgii,
no. 19, 1960, 48 - 50)

TEXT: A photometric method for the determination of Nb is offered, comprising a separation of earth metal, titanic, and tungstic acids by hydrolysis. The calcinated mixture of oxides is broken up by melting with $K_2S_2O_7$, dissolving the melt in dilute H_2SO_4 , followed by a separation of Nb by means of alkali and in the presence of Fs_3^+ . By this, tungsten remains in solution and allows to determine Nb photometrically with the aid of sulfocyanide. The actual determination is performed by dissolving 1 g of steel in a mixture of 40 ml of conc. HCl + 10 ml of conc. HNO_3 ; this solution is evaporated to syrupy consistency, and this procedure is

Card 1/3

Determination of niobium in steels...

S/081/61/000/019/029/085
B110/B101

repeated twice under adding 1 ml of conc. HCl each. The residue is then diluted with 40 ml HCl (1:4) and heated for 1 hr. Then follows a dilution with 5 ml of conc. HCl and 200 ml of hot water, also adding some paper pulp; heating is continued for 1 - 2 hr. The residue, containing SiO_2 , tungstic, and niobic acids is filtered off and washed with hot HCl (1:20). The residue is intensely heated in a Pt crucible to 800 - 900°C, followed by melting with 1 - 2 g $\text{K}_2\text{S}_2\text{O}_7$, and dissolving the melt in 30 ml of H_2SO_4 (1:4). 15 ml of a 0.8% FeCl_3 solution is added, and a 20% NaOH solution is admixed up to a slightly alkaline reaction. Then the NaOH content was raised to ~5%. This solution is boiled, filtered off and washed with a 5% NaOH solution. The filter and residue is then transferred to a beaker and heated with 40 ml of a 20% tartaric acid solution until complete dissolution of the residue. The filter is destroyed by a glass rod. This solution is filtered, followed by a 6 - 8 times wash with hot water and a final dilution to 250 ml. A 100-ml graduated flask is then filled with 24 ml HCl (sp. grav. 1.12) + 6 ml of water and 24 ml of acetone. After cooling to room temperature, 10 ml of the solution to be tested is added, as well as 24 ml of a 30% KSCN solution, 3 ml of a 20% SnCl_2 solution,

TITLE: Excitation spectra of the Gudden-Pohl effect in copper-activated zinc-sulfide phosphors

SOURCE: Optika i spektroskopiya, v. 18, no. 5, 1965, 894-896

TOPIC TAGS: emission spectrum, zinc compound optic material, optic activity, phosphorescence, luminescence, photoconductivity

ABSTRACT: This is a continuation of earlier work (DAN SSSR v. 149, 1419, 1963 and v. 150, 519, 1963), in which the emission spectra of the Gudden-Pohl effect in ZnS-Cu,Sn phosphor was measured. To measure the excitation spectra, it was necessary to get rid of the combined excitation effects which increase the phosphorescence of the impurity and also the Gudden-Pohl effect. Since it was shown in the earlier work that the Gudden-Pohl effect involves not only an excita-

Card 1/3

L 64497-65

ACCESSION NR: AP5012623

tion of the activation centers by short-wave illumination but also a stable internal electric field resulting from the superposition of an external field on the phosphor in the presence of excitation, precautions were taken in the experiments to quench the mechanism whereby excitation of the surrounding phosphor is transported to the Gudden-Pohl effect centers. This was done by application of AC voltage without illumination to the phosphors. This left only a second-order Gudden-Pohl effect, which was the main object of the measurements. The preparation of the phosphor powders and the test technique are briefly described. The Gudden-Pohl excitation spectra were found to consist of a single band which practically coincides with the ZnS (358 nm) and agrees with the long-wave absorption edge of pure ZnS (2.05 eV). It is therefore concluded that the primary act in the excitation of Gudden-Pohl luminescence consists in an electron transfer from the filled band to the conduction band and establishment of photoconductivity. Measurements of the phosphorescence excitation spectra, which were determined together with the Gudden-Pohl excitation spectra, confirmed the model wherein the phosphorescence centers

Card 2/7

L 64497-68
ACCESSION NR: AF5012623

and the Gudden-Pohl flash emission centers coincide in the same phosphor as long as there is not protective field to create special conditions for Gudden-Pohl centers. We thank N. N. Kalibabchuk for the analysis of the phosphor and L. S. Pekar for preparation of the ZnS-Cu,Cl specimens. Orig. art. has: 4 figures.

TITLE: Three types of Gudden-Pohl effect and the phosphorescence of copper-activated zinc sulfide

SOURCE: Optika i spektroskopiya, v. 19, no. 6, 1965, 943-950

TOPIC TAGS: zinc sulfide, phosphorescence, luminescent center

ABSTRACT: The authors consider a characteristic property of the Gudden-Pohl effect (GPE) which consists in the conservation for an extended period of time in the solid dielectric of a certain portion of the absorbed light energy in the form of ionized luminescence centers and electrons, with their radiation recombination controlled by the electrical field. The mechanism of GPE center excitation is considered, and three types of GPE are described. The possible interaction of these types is analyzed. The paper deals primarily with a study of the physical nature and laws of the 2nd and 3rd types of GPE, with particular attention given the derivation of the 3rd type and its control. The 2nd type is the effect arising as the result of the preliminary combined effect of shortwave radiation and the internal electric field; the 3rd type is the

Card 1/2

UDC: 535.373

L 11938-66

ACC NR: AP6001649

effect obtained as the result of new excitation arising without new radiation. The excited luminescence centers of the GPB in copper-activated zinc sulfide luminescent materials are regarded as phosphorescence centers protected by local fields against recombination. The characteristics of the 2nd and 3rd types of GPB are defined and methods of controlling these processes are devised. Orig. article has: 2 tables and 6 figures.
